Subject: Preliminary Site Investigation for Angeles  
Chemical, Santa Fe Springs, California - DPW File  
Number I-10173-3E

Dear Sir:

Enclosed are two copies of the preliminary site investigation  
for the subject site. The investigation was requested by  
your department under the Hazardous Materials Underground  
Storage Leak Detection Program.

If you have any questions, please feel free to contact either  
of the undersigned.

Very truly yours,

*Daniel Roeser*

#### DISCLAIMER

This report has been specifically prepared for Angeles Chemical, with specific application to a preliminary site investigation for the property located at 8915 Sorenson Avenue, Santa Fe Springs, California. This report has been prepared in accordance with the care and skill generally exercised by reputable professionals, under similar circumstances, in this or similar localities. No other warranty, either expressed or implied, is made as to the professional advice presented herein.

PRELIMINARY SITE INVESTIGATION  
ANGELES CHEMICAL  
SANTA FE SPRINGS, CALIFORNIA

INTRODUCTION

Angeles Chemical retained SCS Engineers (SCS) to conduct an underground tank investigation program at Angeles Chemical, Santa Fe Springs, California (Figure 1). The purpose of this project was to test subsurface soils in the vicinity of the facility as a permitting requirement of the Los Angeles Department of Public Works. Current inventory control measures and tank integrity testing have not identified any leaks in the 34 underground storage tanks.

SURROUNDING LAND USE

All sites immediately adjacent to the subject site are zoned for and occupied by industrial facilities. Several of these properties have been identified on regulatory lists as having potential or identified environmental problems.

The property located immediately to the south of the subject site, McKesson Chemical Company, 9005 Sorenson Avenue, Santa Fe Springs, California, is listed on the California Department of Health Services' (DHS) Bond Expenditure Plan (BEP). Information obtained from DHS indicates that McKesson Chemical Company is in the process of completing a remedial investigation for this site. The remedial investigation report is anticipated to be available to the public in March 1991.

Preliminary investigations for McKesson Chemical Company, which are currently available at DHS's Burbank office, were reviewed in August 1990. These investigations indicated that chemicals formerly stored in on-site above and underground storage tanks were detected in a perched aquifer at 22 feet (possibly a seasonal water table) and in soils in the vicinity of the above ground tanks. Chemicals stored in the above ground tanks at McKesson included: ethylene glycol, propylene glycol, glycol ether, ethylbenzene, 1,1,1-trichloroethene, methylene chloride, and tetrachloroethene (PERC).

Liquid Air at 8832 Dice Road, Santa Fe Springs, California is located immediately west of the subject site. Water and residues from acetylene production were observed in a unlined pit on this property. The pit is adjacent to and could pos-

sibly influence ground water underneath the subject site. Inquiry to the California Regional Water Quality Control Board indicated that Liquid Air does not have a waste discharge permit.

#### REGIONAL GEOLOGY AND HYDROGEOLOGY

Angeles Chemical is located in the Los Angeles Coastal Plain at an elevation of approximately 150 feet above mean sea level. The nearest major fault zones are the Whittier Fault Zone located about 3.5 miles to the northeast and the New-port-Inglewood Fault Zone approximately 11 miles southwest.

Surficial sediments (to a depth of about 30 feet) consist of Holocene stream and flood deposits composed of interbedded gravel, sand, silt, and clay. Sediments underlying these belong to the Lakewood Formation of Pleistocene age. These also consist of interbedded gravels, sands, and silts deposited in a fluvial system. Distinguishing between these two units is difficult, if not impossible, in this area.

The site lies within the Central Basin Pressure area, a division of the Central Ground Water Basin which extends over most of the Coastal Plain. First regional ground water in the region is found in the Gage Aquifer within the Lakewood Formation which is approximately 45 feet below grade in the vicinity of the subject site. This ground water is of poor quality and is not potable. Ground water typically flows to the southwest in the Gage Aquifer.

#### ON-SITE INVESTIGATIONS

##### Drilling and Sample Collection - January 18, 1990

Eight soil borings (BH1 through BH8) were drilled to depths of 20, 20, 20, 23, 50, 20, and 20 feet. Boring locations are shown in Figure 2. Soil Samples were retrieved at five foot intervals as described in the approved work plan for the investigation (Work Plan dated April 23, 1986 with modifications listed in SCS letter dated March 14, 1989).

Soil samples were obtained by placing 3-inch and 6-inch long stainless steel or brass sample sleeves inside a Modified California Sampler. The sampler was then driven into the soil ahead of the hollow stem auger using a 140 pound slide hammer. Each time the sampler was retrieved, a representative sample from the lowermost intact sample sleeve was removed, covered with aluminum foil, sealed on both ends with tight-fitting plastic end caps, and secured with electrical tape.

Each sample was identified with a chain-of-custody sample tag and placed in a refrigerated cooler for transport to the SCS Analytical Laboratory. Chain-of-custody forms were appropriately completed by our field geologist to ensure proper and accurate tracking/analysis in the laboratory. Specific data regarding project number, sample location, and analyses to be performed were recorded on the chain-of-custody forms.

#### Sample Collection - April 5, 1990

Based on field observations and analytical results for samples collected in boring BH6, further on-site investigation was recommended in the vicinity of a spill drain, which is located near the southeast corner of the tank farm. On April 5, 1990, concrete approximately eight inches thick adjacent to the concrete spill drain was cut and removed in order to expose the surrounding soils. Soils consisted of black and brown sandy clays, with strong hydrocarbon odors. OVA readings ranged from 400 to 700 parts per million (ppm). Due to the spill drain's proximity to the underground storage tanks, further safe excavation was not possible. Therefore, further exploration by drilling was recommended.

*+ clean sand*

#### Drilling and Soil Sample Collection - June 25-26, 1990

Seven exploratory borings were drilled from June 25-26, 1990. One of these borings (MW1) was converted to a ground water monitoring well on June 26, 1990; this and the others (BH9 through BH14) are shown on Figure 2. Borings drilled on June 25, 1990 were installed with a 7 inch hollow stem auger to depths of 30, 20.5, 35, 34 and 40 feet. These borings were drilled using a Mobile B-47 drill rig. Soil samples were collected at five foot intervals.

On June 26, 1990, borings MW1 and BH14 were drilled to depths of 60 feet and 40 feet, respectively. Boring MW1 was drilled utilizing 11-inch hollow stem auger. BH14 was drilled using a 7-inch hollow stem auger. These borings were drilled using a Mobile B-61 drill rig. Soil samples were collected at five foot intervals, and were retrieved and logged using the same procedure described above.

#### Well Installation

One ground water monitoring well was constructed on-site in borehole MW1 using 4-inch diameter Schedule 40 PVC well pipe. Casing sections were joined using flush-set, threaded pipe connections; no glue connections were used.

Factory slotted 4-inch diameter PVC casing with 0.020-inch

washing thoroughly in a TSP and water solution and rinsing in distilled water, or was steamed cleaned, prior to its use in the well. . .

#### Water Sampling

After development, 45 additional gallons of water (approximately 4 casings volumes) were purged from the well and pH, electroconductivity, and temperature were measured in order to verify that a representative water sample from the formation was obtained. After field readings had stabilized, ground water was collected from the well by lowering a 3-inch stainless steel sampler into the well. Samples and duplicates were placed in 40 ml sample bottles supplied by the laboratory. Immediately upon collection, samples were labelled and logged. Chain-of-custody documentation was completed for each sample. Samples were stored in a field cooler until their delivery to the SCS Analytical Laboratory in Long Beach, California.

All sampling equipment coming in contact with ground water was thoroughly cleaned prior to and after sampling by washing with in a TSP solution and double rinsing with distilled water.

#### ON-SITE GEOLOGY AND HYDROGEOLOGY

Soils encountered on the north side of the site to a depth of approximately 18 feet consisted of silts, clayey silts, and silty sands. Below 18 feet, soils consisted of medium to coarse grained sands and gravel. On the south portion of the site soils consisted of silts and silty sands to a depth of approximately 18 feet. Below this there was a thin layer of medium to coarse sands approximately five feet thick. Below this layer of medium to coarse sands, finer sediment such as clays, silts, and sandy silts were encountered to a depth of approximately 45 feet. Medium-grained and medium to coarse grained layers of sand were encountered from 45 feet to 60 feet (total depth for borehole MW1).

Based on observation of soils and depths to ground water within the borings it appears that there may be a separate perched water table on the north side of the subject site. Ground water was encountered on the northern portion of the subject site at a depth of approximately 32 feet during the drilling activities in June 1990. Water on the southwestern portion of the property was encountered at depths of approximately 45 feet. This deeper ground water is believed to be in the Gage aquifer.

TABLE 1. SUMMARY OF ANALYTICAL RESULTS FOR ORGANIC COMPOUNDS - JANUARY 1990

## Notes:

1. Refer to Figure 2 for sample locations.
2. EB = ethylbenzene, MEK = 2-butanone, MIBK = 4-methyl-2-pentanone, PERC = tetrachloroethene  
1,1,1-TCA = 1,1,1-trichloroethane, TCE = trichloroethene.
3. ND = not detected.

at concentrations ranging from 9,300 ug/kg in sample BH14-15 to 54 ug/kg in sample BH12-20. PERC was detected at concentrations ranging from 48,000 ug/kg in sample BH14-20 to 10 ug/kg in sample BH6-50.

Toluene was detected at concentrations ranging from 150,000 ug/kg in sample BH14-20 to 12 ug/kg in samples BH2-15 and BH5-20. 1,1,1-TCA was detected at concentrations ranging from 28,000 ug/kg in BH14-20 to 11 ug/kg in BH7-10. TCE was detected at concentrations ranging from 8,700 ug/kg in sample BH14-5 to 10 ug/kg in sample BH3-5. Xylene was detected at concentrations ranging from 233,000 ug/kg in sample BH14-5 to 10 ug/kg in sample BH6-5.

#### Grab Samples

Grab samples S-1 and S-2, collected near a broken pipeline, which was connected to the spill drain, contained elevated concentrations of ethylbenzene, PERC, toluene, 1,1,1-TCA, TCE, and xylene.

*(check  
book)*  
S-2

Ethylbenzene was detected at concentrations of greater than 210,000 ug/kg, and at 94,000 ug/kg in samples S-1 and S-2, respectively. PERC was detected at concentrations of 33,000 ug/kg and 32,000 ug/kg in samples S-2 and S-1, respectively. Toluene was detected at concentrations of greater than 220,000 ug/kg and 120,000 ug/kg in samples S-1 and S-2, respectively. 1,1,1-TCA was detected at a concentration of 6,400 ug/kg in sample S-1. TCE was detected at concentrations of 9,900 ug/kg and 5,100 ug/kg in samples S-1 and S-2, respectively. Xylene was detected at concentrations of greater than 540,000 ug/kg, and at 264,000 ug/kg in samples S-1 and S-2, respectively.

In addition, sample S-2 contained a concentration of 99 mg/kg (parts per million-ppm) of total petroleum hydrocarbons (TPH) as determined using EPA Method 418.1.

#### Ground Water Samples

Ground water sample MW1-1, collected from MW1, was analyzed for EPA 624 components volatile organic compounds (VOCs). Analytical reports are contained in Appendix B and Table 2.

The following EPA 624 compounds were detected in the ground water sample analyzed (MW1-1): benzene, 1,1-DCA, 1,1-DCE, PERC, toluene, 1,1,1-TCA, TCE, and xylene. Benzene was detected at a concentration of 10 ug/l. 1,1-DCA and 1,1-DCE were detected at concentrations of 21 ug/l and 270 ug/l,

piping was plugged with concrete where it penetrates the spill drain.

#### Ground Water

Elevated levels of VOCs were also detected in sample MW1-1. Benzene, 1,1-DCA, 1,1-DCE, PERC, TCE, and trans-1,2-DCE were all detected at concentrations considerably above their respective maximum contaminant level (MCL). In addition, toluene, 1,1,1-TCA and xylene were detected at concentrations below their respective MCL or state recommended action level (AL).

With water level data from one well it is not possible to determine the direction of ground water flow beneath the subject site or whether ground water contaminants may have migrated from on-site or off-site sources. In addition, due to the variances in lithologies and depth to ground water encountered on-site, it appears that both a perched aquifer and the Gage aquifer were encountered during drilling. Based on present information it is not possible to determine if the two aquifers are hydraulically connected.

In addition, it is unknown what affect discharged water in the unlined pit at Liquid Air Products have on the ground water and soils beneath the subject site. Water discharged to the ground may alter ground water levels and flow direction. The chemistry of the discharged water is also unknown.

#### RECOMMENDATIONS

Additional ground water investigation is recommended for the subject site. Prior to such an investigation, SCS recommends review of the remedial investigation for the McKesson site, which will be available in March 1991. Information obtained from the McKesson remedial investigation would be beneficial for planning further investigative work at the subject site.

After review of this information, it is recommended that a work plan be prepared describing further ground water monitoring. This report is to be submitted to the lead regulatory agency.
